

Packet format (for example):

Causes:

- Every stream element which doesn't do internal buffering must make its output GSource ready at least as often as its input — this results in over-rotation for demux outputs.
  - Buffer handling in the multiplexer gets hairy.
- Key points:
- Every stream element which does buffering can ~~be~~ partition the clearing of unbuffered pulls
  - Manual allocations above could be taken from pre-allocated receive buffers, or be static
